# GuardPointPro - Salto Integration

We have developed a way to sync the SALTO database with the GuardPointPro database in order to manage people from only one location (i.e. GuardPointPro).

From GuardPointPro version 3.2.029 (or greater), triggers in the GuardPointPro SQL DB write in a separated table every change made in the Cardholder screen.
Salto is able to connect to the GuardPointPro DB and read the data from this separated table any time.

Then, when creating/deleting a cardholder or making any changes in the below Cardholder fields, both systems are updated in real time:

First name
Last name
Access group list (from GuardPointPro cardholder screen)
Card code (the code of the cardholder's card in GuardPointPro badge screen)
Please contact us for more information or you can also download the document and required SQL script that explains how to activate the Salto Integration.
